

MAT 115E Introduction to Programming Language

Lab-11/ CRN : 23492

Instructor: Dr. Evren Tanrıöver

Lab Assistant: Res. Asst. Tugce Sezer

1 Question 1

Write a C program that accomplishes the followings:

A USER-DEFINED FUNCTION:

- It takes a string as a parameter.
- It finds and returns the reverse of the given string.

MAIN FUNCTION:

- Read a string from console.
- Find the reverse of the string.
- Print the reversed string.

2 Question 2

Write a C program that accomplishes the followings:

A USER-DEFINED FUNCTION:

- It takes a string and a character as parameters.
- It finds the first occurrence of the given character in the string, and returns it. The function returns -1 when the character is not present in the string.

MAIN FUNCTION:

- Read a string and a character from user.
- Pass these data you received from the user to the function.
- If the function returns a value other than -1, you should print the rest of the string starting from the first occurrence of the character. If it returns -1, you should print the message as "The character does not exist in the string."

Example Scenario:

Let the string be 'Mathematical' and the character be 'a'. Then the function must return 1 for the location and the main function should print the string 'athematical' to the screen.

3 Question 3

As is known, encryption is very old. The most primitive coding technique is done by shifting the letters one in a string to the right. According to this information, write a C function that takes a string as a parameter and returns the encrypted string.

For example, if the string is "Zero" then the encrypted string must be "Afsp"
